- ▶ Telecommunication and management system
- ▶ Industrial battery banks, charger unit and UPS systems.

ROAD SURFACE MARKING

Road surface markings are used on paved roadways to provide guidance and information to drivers and pedestrians . Uniformity of the markings is an important factor in minimizing confusion and uncertainty about their meaning , and efforts exist to standardize such markings across borders. However, countries and areas categorize and specify road surface markings in different ways – white lines are called white lines mechanical, non- mechanical , or temporary . They can be used to delineate traffic lanes, inform motorists and pedestrians or serve as noise generators when run across a road , or attempt to wake a sleeping driver when installed in the shoulders of a road . Road surface marking can also indicate regulations for parking and stopping.

There is continuous effort to improve the road marking system , and technological breakthroughs include adding retro reflectivity, increasing longevity , and lowering installation cost.

Today , road markings are used to convey a range of information to the driver spanning navigational, safety and enforcement issues leading to their use in road environments understanding within advanced driver – assistance systems and consideration for future use in autonomous road vehicles.
